 SSD1289

# 1 GENERAL DESCRIPTION

SSD1289 is an all in one TFT LCD Controller Driver that integrated the RAM, power circuits, gate driver and source driver into a single chip. It can drive up to 262k color amorsphous TFT panel with resolution of 240 RGB x 320.

It also integrated the controller function and consists of 172,800 bytes (240 x 320 x 18 / 8) Graphic Display Data RAM (GDDRAM) such that it interfaced with common MPU through 8-/9-/16-/18-bit 6800-series / 8080-series compatible parallel interface or serial peripheral interface and stored the data in the GDDRAM. Auxiliary 18-/16-/6-bit video interface (VSYNC, HSYNC, DOTCLK, DEN) are integrated into SSD1289 for animation image display.

SSD1289 embeds DC-DC Converter and Voltage generator to provide all necessary voltage required by the driver with minimum external components. A Common Voltage Generation Circuit is included to drive the TFT-display counter electrode. An Integrated Gamma Control Circuit is also included that can be adjusted by software commands to provide maximum flexibility and optimal display quality.

SSD1289 can be operated down to 1.4V and provide different power save modes. It is suitable for any portable battery-driven applications requiring long operation period and compact size.

#### 2 FEATURES

- 240RGBx320 single chip controller driver IC for 262k color amorphous TFT LCD
- Power Supply
  - VDDEXT = 1.4V 3.6V (Internal Logic)
  - VDDIO = 1.4V 3.6V (I/O Interface)
  - VCI = 2.5V 3.6V (power supply for internal analog circuit)
- Output Voltages
  - Gate Driver:
    - $VGH-GND = 9V \sim 15V$
    - VGL- $GND = -7 \sim -15V$
    - VGH-VGL = 30Vp-p
  - Source Driver:
    - V0 V63 = 0 5V
    - Typical Source Output Voltage variation: ±10 mV
  - VCOM drive:
    - VCOMH =  $3.0V \sim 5.0V$
    - $VCOML = -2.0V \sim -3.0V$
    - VCOMHA = 5.5V
- System Interface
  - High-speed interface by 8-/9-/16-/18-bit 6800-series / 8080-series parallel ports
  - Serial Peripheral Interface (SPI)
  - Moving picture display interface
  - 6-/16-/18-bit RGB interface (DEN, DOTCLK, HSYNC, VSYNC, DB17-0)
  - VSYNC interface (system interface + VSYNC)
  - WSYNC interface (system interface + WSYNC)
- Support low power consumption:
  - Low voltage supply
  - Low current sleep mode
  - 8-color display mode for power saving
  - Charge sharing function for step-up circuits
- High-speed RAM addressing functions
  - RAM write synchronization function
  - Window address function
  - Display by RAM data and generic data selectively and simultaneously
  - Vertical scrolling function
  - Picture in Picture mode
  - Partial display mode
- Internal power supply circuit
  - Voltage generator
  - DC-DC converter up to 6x/-6x
- Built-in internal oscillator
- Internal GDDRAM capacity: 172800Byte
- Support Frame and Line inversion AC drive
- TFT storage capacitance: Cs on common and Cs on gate
- Support source and gate scan direction control
- Programmable gamma correction curve
- 4 Preset gamma correction curve
- Built-in Non Volatile Memory for VCOM calibration Display Size: 240 RGB x 320
- Support flexible arrangement of gate circuits on both sides of the glass substrate

# **6 PIN DESCRIPTION**

Remark:

I = Input; O = Output; IO = Bi-directional; P = Power; VCC = System VDD; GND = System VSS;

Table 6-1: Power Supply Pins

Name	Type	Connect to	Function	Description	When not in use
$V_{SS}$		GND		System ground pin of the IC.	-
$AV_{SS}$	1	GND	Ground of	Grounding for analog circuit.	-
$V_{\rm SSRC}$	P	GND	the Power Supply	Grounding for analog circuit. This pin requires a noise free path for providing accurate LCD driving voltages.	-
$V_{CHS}$	1	$AV_{SS}$		Grounding for booster circuit.	-
V <sub>CI</sub>		Power Supply	Power Supply for	Booster input voltage pin Connect to voltage source between 2.5V to 3.6V	-
$V_{CIP}$	Р	$ m V_{CI}$	Analog Circuits	Voltage supply pin for analog circuit. This pin requires a noise free path for providing accurate LCD driving voltages Connect to same source of $V_{\rm CI}$	-
$V_{\text{CIM}}$	0	Stabilizing capacitor	Booster	Negative voltage of V <sub>CI</sub> .	-
$V_{CIX2}$		Stabilizing capacitor	voltages	Equals to 2x V <sub>CI</sub>	-
$V_{CIX2J}$	P	V <sub>CIX2</sub> on FPC	Voltage for	They are the power supply used by on chip analog blocks and VGH/VGL	-
$V_{CIX2G}$	Р	V <sub>CIX2</sub> on FPC	analog	dede.	-
V <sub>COMR</sub>	I	External voltage source or Open	External Reference	This pin provides voltage reference for internal voltage regulator when register VDV[4:0] of Power Control 4 set to "01111".  - Connect to an external voltage source for reference	Open
V <sub>COMH</sub>	0	Stabilizing capacitor	Voltages for	This pin indicates a HIGH level of VCOM generated in driving the VCOM alternation.	-
V <sub>COML</sub>	О	Stabilizing capacitor	VCOM Signal	This pin indicates a LOW level of VCOM generated in driving the VCOM alternation.	-

# 7 BLOCK FUNCTION DESCRIPTION

# 7.1 System Interface

The System Interface unit consists of three functional blocks for driving the 6800-series parallel interface, 8080-series high speed parallel interface, 3-lines serial peripheral interface and 4-lines serial peripheral interface. The selection of different interface is done by PS3, PS2, PS1 and PS0 pins. Please refer to the pin descriptions on page 19.

#### a) MPU Parallel 6800-series Interface

The parallel Interface consists of 18 bi-directional data pins D[17:0],  $R/\overline{W}$ ,  $D/\overline{C}$ , E and  $\overline{CS}$ .  $R/\overline{W}$  input high indicates a read operation from the Graphical Display Data RAM (GDDRAM) or the status register.  $R/\overline{W}$  input low indicates a write operation to Display Data RAM or Internal Command Registers depending on the status of  $D/\overline{C}$  input. The E input serves as data latch signal (clock) when high provided that  $\overline{CS}$  is low. Please refer to Parallel Interface Timing Diagram of 6800-series microprocessors. In order to match the operating frequency of the GDDRAM with that of the MCU, pipeline processing is internally performed which requires the insertion of a dummy read before the first actual display data read. This is shown in the following diagram.

Figure 7-1 - Read Display Data

# b) MPU Parallel 8080-series Interface

The parallel interface consists of 18 bi-directional data pins D[17:0],  $\overline{RD}$ ,  $\overline{WR}$ , D/ $\overline{C}$  and  $\overline{CS}$ .  $\overline{RD}$  input serves as data read latch signal (clock) when low provided that  $\overline{CS}$  is low. Whether reading the display data from GDDRAM or reading the status from the status register is controlled by D/ $\overline{C}$ .  $\overline{WR}$  input serves as data write latch signal (clock) when low provided that  $\overline{CS}$  is low. Whether writing the display data to the GDDRAM or writing the command to the command register is controlled by D/ $\overline{C}$ . A dummy read is also required before the first actual display data read for 8080-series interface. Please refer Figure 7-1.

# c) MPU 4-lines Serial Peripheral Interface

The 4-lines serial peripheral Interface consists of serial clock SCK, serial data SDI,  $D/\overline{C}$  and  $\overline{CS}$ . SDI is shifted into 8-bit shift register on every rising edge of SCK in the order of data bit 7, data bit 6 ...... data bit 0.  $D/\overline{C}$  is sampled on every eighth clock to determine whether the data byte in the shift register is written to the Display Data RAM or command register at the same clock.

# d) MPU 3-lines Serial Peripheral Interface

The operation is similar to 4-lines serial peripheral interface while  $D/\overline{C}$  is not used. There are altogether 9-bits will be shifted into the shift register on every ninth clock in sequence:  $D/\overline{C}$  bit, D7 to D0 bit. The  $D/\overline{C}$  bit (first bit of the sequential data) will determine the following data byte in the shift register is written to the Display Data RAM ( $D/\overline{C}$  bit = 1) or the command register ( $D/\overline{C}$  bit = 0).

	6800 – series Parallel Interface	8080 – series Parallel Interface	MCU Serial Interface
Data Read	18/16/9/8-bits	18/16/9/8-bits	No
Data Write	18/16/9/8-bits	18/16/9/8-bits	8-bits
Command Read	Status only	Status only	No
Command Write	Yes	Yes	8-bits

Table 7-1 - Data bus selection modes

## 7.2 RGB Interface

SSD1289 supports RGB interface and VSYNC interface as the moving display interace to display animation image. RGB interface unit consists of D[17:0], HSYNC, VSYNC, DOTCLK and DEN signals for display moving pictures. When the RGB interface is selected, the display operation is synchronized with external control signals (HSYNC, VSYNC and DOTCLK). In this operation, Data D[17:0,] will be treated as RR[5:0], GG[5:0] and BB[0:5], is written in synchronization with the control signals when DEN is enabled for write operation in order to avoid flicker or tearring effect while updating display data.

Table 7-2: RGB signal matching in data bus

Data Bus	RGB signals
D[17:12]	RR[5:0]
D[11:6]	GG[5:0]
D[5:0]	BB[0:5]

In VSYNC interface operation, the display operation is synchronized with the internal clock, which synchronizes the display operation with the VSYNC signal. The display data is written to the GDDRAM through the system interface. When writing data via VSYNC interface, the speed of writing data in the internal RAM is faster from the falling edge of frame synchronous (VSYNC) than calculated minimum speed. The display may be updated even the data written in the RAM is not completed. In this operation, some restrictions in setting the frequency and the method to write data to the internal RAM are required.

# 7.3 Address Counter (AC)

The address counter (AC) assigns address to the GDDRAM. When an address set instruction is written into the IR, the address information is sent from the IR to the AC.

After writing into the GRAM, the AC is automatically incremented by 1 (or decremented by 1). After reading the data, the AC is not updated. A window address function allows for data to be written only to a window area specified by GRAM.

# 7.4 Graphic Display Data RAM (GDDRAM)

The GDDRAM is a bit mapped static RAM holding the bit pattern to be displayed. The size of the RAM is 240 RGB x  $320 \times 18 / 8 = 172,800$  bytes. For mechanical flexibility, re-mapping on both Segment and Common outputs can be selected by software. Please refer to the command "Data Output/Scan direction" for detail description.

Four pages of display data forms a RAM address block and stored in the GDDRAM. Each block will form the fundamental units of scrolling addresses. Various types of area scrolling can be performed by software program according to the command "Set area Scroll" and "Set Scroll Start".

 SSD1289

# 7.5 Gamma/Grayscale Voltage Generator

The grayscale voltage circuit generates a LCD driver circuit that corresponds to the grayscale levels as specified in the grayscale gamma adjustment resister. 262,144 possible colors can be displayed when 1 pixel = 18 bit. For details, see the gamma adjustment register.

# 7.6 Booster and Regulator Circuit

These two functional blocks generate the voltage of VGH, VGL, VCOM levels and VLCD0~63 which are necessary for operating a TFT LCD.

# 7.7 Timing Generator

The timing generator generates a timing signal for the operation of internal circuit such as the internal RAM accessing, date output timing etc.

# 7.8 Oscillation Circuit (OSC)

This module is an on-chip low power RC oscillator circuitry. The oscillator generates the clock for the DC-DC voltage converter. This clock is also used in the display timing generator.

# 7.9 Data Latches

This block is a series of latches carrying the display signal information. These latches hold the data, which will be fed to the HV Buffer Cell and Level Selector to output the required voltage level.

# 7.10 Liquid Crystal Driver Circuit

SSD1289 consists of a 720-output source driver (S0-S719) and a 320-output gate driver (G0-G319). The display image data is latched when 720 bits of data are inputted. The latched data control the source driver and output drive waveforms. The gate driver for scanning gate lines outputs either VGH or VGL level. The shift direction of 720-bit source output from the source driver can be changed by setting the RL bit and the shift direction of gate output from the gate driver can be changed by setting the TB bit. The scan mode by the gate driver can be changed by setting the SM bit. Sets the gate driver pin arrangement in combination with the TB bit to select the operimal scan mode for the module.

# 9 COMMAND DESCRIPTION

#### Index (IR)

R/V	/ DC	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	0	0	0	0	0	0	0	0	0	ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0

The index instruction specifies the RAM control indexes (R00h to RFFh). It sets the register number in the range of 000000000 to 111111111 in binary form. But do not access to Index register and instruction bits which do not have it's own index register.

#### Device Code Read (R00h)

	R/W	DC	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
ĺ	R	1	1	0	0	0	1	0	0	1	1	0	0	0	1	0	0	1

If this register is read forcibly, 8989h is read.

# Oscillator (R00h) (POR = 0000h)

R/W	DC	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	OSCEN
PC	R	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**OSCEN:** The oscillator will be turned on when OSCEN = 1, off when OSCEN = 0.

# **Driver Output Control (R01h) (POR = [0XXXX0X1]3Fh)**

ľ	PC	)R	0	Х	Х	Х	Х	0	Х	1	0	0	1	1	1	1	1	1
Ī	W	1	0	RL	REV	CAD	BGR	SM	ТВ	MUX8	MUX7	MUX6	MUX5	MUX4	MUX3	MUX2	MUX1	MUX0
	R/W	DC	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0

Note: The POR value of REV, CAD, BGR, TB and RL are determined by the corresponding hardware pin state. The software bit setting will override hardware setting if this command is sent.

**REV:** Displays all character and graphics display sections with reversal when REV = "1". Since the grayscale level can be reversed, display of the same data is enabled on normally white and normally black panels. Source output level is indicated below.

REV	RGB data	Source O	utput level
		Vcom = "L"	Vcom = "H"
	00000H	V63	V0
0	:	:	:
	3FFFFH	V0	V63
	00000H	V0	V63
1	:	:	:
	3FFFFH	V63	V0

**CAD:** Set up based on retention capacitor configuration of the TFT panel.

CAD	Retention capacitor configuration					
0 Cs on Common						
1	Cs on Gate					

**BGR:** Selects the order from RGB to BGR in writing 18-bit pixel data in the GDDRAM.

When BGR = "0" <R><G><B> color is assigned from S0.

When BGR = "1" <B><G><R> color is assigned from S0.

 **SM:** Change scanning order of gate driver.

SM	Gate scan squence (GD='0')
0	G0, G1, G2, G3G219 (left and right gate interlaced)
1	G0, G2,G318, G1, G3,G319

See "Scan mode setting" on next page.

**TB:** Selects the output shift direction of the gate driver.

When TB = 1, G0 shifts to G319.

When TB = 0, G319 shifts to G0.

**RL:** Selects the output shift direction of the source driver.

When RL = "1", S0 shifts to S719 and <R><G><B> color is assigned from S0.

When RL = "0", S719 shifts to S0 and <R><G><B> color is assigned from S719.

Set RL bit and BGR bit when changing the dot order of R, G and B. RL setting will be ignored when display with RAM (Dmode[1:0] = 00).

**MUX[8:0]:** Specify number of lines for the LCD driver. MUX[8:0] settings cannot exceed 319. Remark: When using the partial display, the output for non-display area will be minimum voltage.

# LCD-Driving-Waveform Control (R02h) (POR = 0000h)

R/W	DC	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	0	0	0	FLD	<b>ENWS</b>	B/C	EOR	WSMD	NW7	NW6	NW5	NW4	NW3	NW2	NW1	NW0
PC	R	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**FLD:** Set display in interlace drive mode to protect from flicker. It splits one frame into 3 fields and drive.

When FLD = 1, it is 3 field driving, which also limit VBP = 1 and cannot be used for Cs on gate panel type. That is CAD = 1 & FLD = 1 cannot be coexist.

When FLD = 0, it is normal driving.

The following figure shows the gate selection when the 3-field invension is enabled and the output waveform of the 3-field interlaced driving.

Table 9-1: 3-field interlace driving

TB = 1			TB = 0		
Gate	FLD = 0	FLD = 1	Gate :	FLD = 0	FLD = 1
G0	X		G319	X	
G1	X		G318 ¦	X

 Rev 1.1
 P 31/81
 Sep 2006
 Solomon Systech

**B/C:** Select the liquid crystal drive waveform VCOM.

When B/C = 0, frame inversion of the LCD driving signal is enabled.

When B/C = 1, a N-line inversion waveform is generated and alternates in a N-line equals to NW[7:0]+1.

**EOR:** When B/C = 1 and EOR = 1, the odd/even frame-select signals and the N-line inversion signals are EORed for alternating drive. EOR is used when the LCD is not alternated by combining the set values of the lines of the LCD driven and the N-lines.

**NW[7:0]:** Specify the number of lines that will alternate at the N-line inversion setting (B/C = 1). N-line is equal to NW[7:0]+1.

Figure 9-2: Line Inversion AC Driver

Solomon Systech Sep 2006 | P 32/81 | Rev 1.1 | SSD1289

**ENWS:** When ENWS = 1, it enables WSYNC output pin. Mode1 or Mode2 is selected by WSMD. When ENWS = 0(POR), it disables WSYNC feature, the WSYNC output pin will be high-impedance.

**WSMD** = 0 is **mode1**, the waveform of WSYNC output will be:

**tn** is the time when there is No Update of LCD screen from on-chip ram content. **tu** is the time when the LCD screen is updating based on on-chip ram content. e.g. fosc = 510 KHz, for 320mux, for = 282 us (6 lines), for = 15.06 ms (320 lines)

**WSMD** = 1 is **mode2**, the waveform of WSYNC output will be:

**For fast write MCU:** MCU should start to write new frame of ram data just after rising edge of long WSYNC pulse and should be finished well before the rising edge of the next long WSYNC pulse.
e.g. 5MHz 8 bit parallel write cycle for 18 bit color depth, or 3MHz 8 bit parallel write cycle for 16 bit color depth.

**For slow write MCU** (Half the write speed of fast write): MCU should start to write new frame ram data after the rising edge of the first short WSYNC pulse and must be finished within 2 frames time. e.g. 2.5MHz 8 bit parallel write cycle for 18 bit color depth.

\* Usually, **mode2** is for slower MCU, while **mode1** is for fast MCU.

**CPR[5:0], CPG[5:0], CPB[5:0]:** Set the value for the compare register, of which the data read out from the GDDRAM or data written to the GDDRAM by the microcomputer are compared. This function is not available in the external display interface mode. In the external display mode, make sure LG[2:0] = "000". CPR[5:0] compares the pins RR[5:0], CPG[5:0] compares the pins GG[5:0], and CPB[5:0] compares the pins BB[5:0]. Refer to Section 14 Interface Mapping for writing methods in RGB data.

#### Display Control (R07h) (POR = 0000h)

F	R/W	DC	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
	W	1	0	0	0	PT1	PT0	VLE2	VLE1	SPT	0	0	GON	DTE	CM	0	D1	D0
	PC	R	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PT[1:0]: Normalize the source outputs when non-displayed area of the partial display is driven.

**VLE[2:1]:** When VLE1 = 1 or VLE2 = 1, a vertical scroll is performed in the 1st screen by taking data VL17-0 in R41h register. When VLE1 = 1 and VLE2 = 1, a vertical scroll is performed in the  $1^{st}$  and  $2^{nd}$  screen by VL1[8:0] and VL2[8:0] respectively.

**SPT:** When SPT = "1", the 2-division LCD drive is performed.

**CM:** 8-color mode setting.

When CM = 1, 8-color mode is selected.

When CM = 0, 8-color mode is disable.

**GON:** Gate off level becomes VGH when GON = "0".

**DTE:** When GON = "1" and DTE = "0", all gate outputs become VGL. When GON = "1" and DTE = "1", selected gate wire become VGH, and non-selected gate wires become VGL.

**D[1:0]:** Display is on when D1 = "1" and off when D1 = "0". When off, the display data remains in the GDDRAM, and can be displayed instantly by setting D1 = "1". When D1= "0", the display is off with all of the source outputs set to the GND level. Because of this, the driver can control the charging current for the LCD with AC driving. When D[1:0] = "01", the internal display is performed although the display is off. When D[1:0] = "00", the internal display operation halts and the display is off. Control the display on/off while control GON and DTE.

GON	DTE	D1	D0	Internal Display Operation	Source output	Gate output
0	0	0	0	Halt	GND	$V_{GH}$
0	0	0	1	Operation	GND	$V_{GH}$
1	0	0	1	Operation	GND	$V_{GOFFL}$
1	0	1	1	Operation	Grayscale level output	$V_{GOFFL}$
1	1	1	1	Operation	Grayscale level output	Selected gate line: V <sub>GH</sub> Non-selected gate line: V <sub>GOFFL</sub>

# Frame Cycle Control (R0Bh) (POR = 5308h)

Gn+1	Non-ove	rlap period	<sup>1</sup> →	<b>—</b>	

Solomon Systech Sep 2006 | P 36/81 | Rev 1.1 | SSD1289

**SDT[1:0]:** Set delay amount from the gate output signal falling edge of the source outputs.

SDT1	SDT0	Delay amount of the source output
0	0	0 clock cycle
0	1	1 clock cycle (POR)
1	0	2 clock cycle
1	1	3 clock cycle

**EQ[2:0]:** Sets the equalizing period.

EQ2	EQ1	EQ0	EQ period
0	0	0	No EQ
0	0	1	2 clock cycle
0	1	0	3 clock cycle
0	1	1	4 clock cycle
1	0	0	5 clock cycle
1	0	1	6 clock cycle
1	1	0	7 clock cycle
1	1	1	8 clock cycle

**DIV[1:0]:** Set the division ratio of clocks for internal operation. Internal operations are driven by clocks which frequency is divided according to the DIV1-0 setting.

DIV1	DIV0	Division Ratio
0	0	1
0	1	2
1	0	4
1	1	8

<sup>\*</sup> fosc = internal oscillator frequency, ~510kHz

**SDIV:** When SDIV = 1, DIV1-0 value will be count. When SDIV = 0, DIV1-0 value will be auto determined.

**SRTN:** When SRTN = 1, RTN3-0 value will be count. When SRTN = 0, RTN3-0 value will be auto determined.

**RTN[3:0]:** Set the no. of clocks in each line. The total number will be the decimal value of RTN3-0 plus 16. e.g. if RTN3-0 = "1010h", the total number of clocks in each line = 10 + 16 = 26 clocks.

#### Frame frequency calculation

For DMode[1:0] = '00'

$$Frame\_frequency = \frac{Fosc}{div \times (rtn + 16) \times (mux + vbp + vfp + 3)}$$

where Fosc = internal oscillator frequency

div = Division ratio determined by DIV[1:0]

rtn = RTN[3:0]

mux = MUX[8:0]

vbp = VBP[7:0]

vfp = VFT[7:0]

for default values of SSD1289

Fosc =  $\sim$ 510KHz, DIV[1:0] = '00', RTN[3:0] = 8, MUX[8:0] = 319, VBP[7:0] = 3, VFP[7:0] = 1,

Frame frequency = 
$$\frac{510K}{1\times(8+16)\times(319+3+1+3)} = \frac{510K}{1\times24\times326} = 65Hz$$

#### Power Control 2 (R0Ch) (POR = 0004h)

R/	W	DC	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
٧	٧	1	0	0	0	0	0	0	0	0	0	0	0	0	0	VRC2	VRC1	VRC0
	POR	٧	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

**VRC[2:0]:** Adjust VCIX2 output voltage. The adjusted level is indicated in the chart below VRC2-0 setting.

VRC2	VRC1	VRC0	VCIX2 voltage
0	0	0	5.1V
0	0	1	5.2V
0	1	0	5.3V
0	1	1	5.4V
1	0	0	5.5V
1	0	1	5.6V
1	1	0	5.7V
1	1	1	5.8V

Note: The above setting is valid when VCI has high enough voltage supply for boosting up the required voltage. The above setting is assumed 100% booster efficiency. Please refer to DC Characteristics for detail.

Solomon Systech Sep 2006 | P 38/81 | Rev 1.1 | SSD1289

#### Power Control 3 (R0Dh) (POR = 0009h)

#### Gate Scan Position (R0Fh) (POR = 0000h)

R/W	DC	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	0	0	0	0	0	0	0	SCN8	SCN7	SCN6	SCN5	SCN4	SCN3	SCN2	SCN1	SCN0
PC	R	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SCN[8:0]: Set the scanning starting position of the gate driver. The valid range is from 0 to 319.

#### Sleep mode (R10h) (POR = 0001h)

R/V	V DC	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	SLP
	POR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

**SLP:** Sleep mode enable bit. In the sleep mode, the internal display operations are halted except the R-C oscillator to reduce current consumption. No change in the GDDRAM data or instructions during the sleep mode is made, although it is retained.

When SLP = 1, the driver enters into the sleep mode.

When SLP = 0, the driver leaves the sleep mode.

#### Entry Mode (R11h) (POR = 6830h)

R/W	DC	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	VSMode	DFM1	DFM0	TRANS	OEDef	WMode	DMode1	DMode0	TY1	TY0	ID1	ID0	AM	LG2	LG1	LG0
Р	OR	0	1	1	0	1	0	0	0	0	0	1	1	0	0	0	0

**VSMode:** When VSMode = 1 at DMode[1:0] = "00", the frame frequency will be dependent on VSYNC.

In VSYNC interface operation, the internal display operation is synchronized with the VSYNC signal. By writing data to the internal RAM at faster than the calculated minimum speed (internal display oerpation speed + buffer), it becomes possible to rewrite the moving picture data without flickering the display and display a moving picture via system interface.

The display operation is performed in synchronization with the internal clock signal generated from the internal oscillator and the VSYNC signal. The display data is written in the internal RAM so that the SSD1289 rewrites the data only within the moving picture area and minimize the number of data transfer required for moving picture display. Therefore, the SSD1289 can write data via VSYNC interface in high speed with low power consumption.

**Solomon Systech** Sep 2006 | P 40/81 | Rev 1.1 | **SSD1289** 

The VSYNC interface has the minimum for RAM data write speed and internal clock frequency, which must be more than the values calculated from the following formulas, respectively.

$$Fosc[Hz] = Frame\_frequency*(mux + vfp + vbp + 3)*(rtn + 16)*(div)$$

$$RAMWriteSpeed(min)[Hz] > \frac{240*mux}{(vbp + mux - m arg ins)*(rtn + 16)*\frac{1}{fosc}}$$

where Fosc = internal oscillator frequency div = Division ratio determined by DIV[1:0] rtn = RTN[3:0] mux = MUX[8:0] vbp = VBP[7:0]

vfp = VFT[7:0]

Note: When RAM write operation is not started right after the falling edge of VSYNC, the time from the falling edge of VSYNC until the start of RAM write operation must also be taken into account.

**DFM[1:0]:** Set the color display mode.

	DFM1	DFM0	Color mode
	1	1	65k color (POR)
Г	1	0	262k color

**TRANS:** When TRANS = 1, transparent display is allowed during DMode[1:0] = "1x".

#### **OEDef:**

When OEDef = 1, OE defines the display window. When OEDef = 0, the display window is defined by R4Eh and R4Fh.

**WMode:** Select the source of data to write in the RAM.

WMode	Write RAM from
0	Normal data bus (POR)
1	Generic interface

**DMode[1:0]:** SSD1289 allows data display from RAM data or from generic input data. When DMode[1:0] = "00", it displays the ram content. When DMode[1:0] = "01", it displays from generic input data.

DMode1	DMode0	Display	Remark
0	0	Ram (POR)	Frame frequency depends on Fosc (POR)
0	1	Generic input	Frame frequency depends on VSYNC, default DMode setting in RGB interface
1	0	RAM and Generic data	In this case, generic data is shown in the display window
1	1	RAM and Generic data	In this case, RAM data is shown in the display window

#### **Picture In Picture Function**

**TY[1:0]:** In 262k color mode, 16 bit parallel interface, there are three types of methods in writing data into the ram, Type A, B and C are described as below.

TY1	TY0	Writing mode
0	0	Type A
0	1	Туре В
1	0	Type C

										Ha	rdwa	are pi	ins							
Interface	Color mode	Cycle	D17	D16	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

Remark : x Don't care bits
Not connected pins

 Solomon Systech
 Sep 2006
 P 42/81
 Rev 1.1
 SSD1289

**ID[1:0]:** The address counter is automatically incremented by 1, after data are written to the GDDRAM when ID[1:0] = "1". The address counter is automatically decremented by 1, after data are written to the GDDRAM when ID[1:0] = "0". The setting of incrementing or decrementing of the address counter can be made independently in each upper and lower bit of the address. The direction of the address when data are written to the GDDRAM is set with AM bits.

**AM:** Set the direction in which the address counter is updated automatically after data are written to the GDDRAM. When AM = "0", the address counter is updated in the horizontal direction. When AM = "1", the address counter is updated in the vertical direction. When window addresses are selected, data are written to the GDDRAM area specified by the window addresses in the manner specified with ID1-0 and AM bits.

**LG[2:0]:** Write data to the GDDRAM after comparing the write data written to the GDDRAM by the microcomputer with the values in the compare registers (CPR[5:0], CPG[5:0]) and performing a logical and arithmetic operation on them.

#### Generic Interface Control (R15h) (POR = 00d0h)

R/W	DC	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0

W	1	0	0	0	0	0	0	0	0	nOTP	0	VCM5	VCM4	VCM3	VCM2	VCM1	VCM0
PO	R*	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0	1

<sup>\*</sup>note: this POR value is for GAMAS[2:0] = 000, for POR values of all GAMAS[2:0] setting please refer to Table 5.

**nOTP:** nOTP equals to "0" after power on reset and VcomH voltage equals to programmed OTP value. When nOTP set to "1", setting of VCM[5:0] becomes valid and voltage of VcomH can be adjusted.

**VCM[5:0]:** Set the VcomH voltage if nOTP = "1". These bits amplify the VcomH voltage 0.35 to 0.99 times the VLCD63 voltage. Default value is "101001" when power on reset.

VCM5	VCM4	VCM3	VCM2	VCM1	VCM0	VcomH
0	0	0	0	0	0	VLCD63 x 0.35
0	0	0	0	0	1	VLCD63 x 0.36
						: Step = 0.01 :
1	1	1	1	1	0	VLCD63 x 0.98
1	1	1	1	1	1	VLCD63 x 0.99

#### Write Data to GRAM (R22h)

R/W	DC	D[17:0]
W	1	WD[17:0] mapping depends on the interface setting

**WD[17:0]:** Transforms all the GDDRAM data into 18-bit, and writes the data. Format for transforming data into 18-bit depends on the interface used. SSD1289 selects the grayscale level according to the GDDRAM data. After writing data to GDDRAM, address is automatically updated according to AM bit and ID bit. Access to GDDRAM during stand-by mode is not available.

#### Read Data from GRAM (R22h)

R/W	DC	D[17:0]
R	1	RD[17:0] mapping depends on the interface setting

**RD[17:0]:** Read 18-bit data from the GDDRAM. When the data is read to the microcomputer, the first-word read immediately after the GDDRAM address setting is latched from the GDDRAM to the internal read-data latch. The data on the data bus (DB17–0) becomes invalid and the second-word read is normal. When bit processing, such as a logical operation, is performed, only one read can be processed since the latched data in the first word is used.

# RAM write data mask (R23h - R24h) (POR = 0000h)

Reg#	R/W	DC	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
R23h	W	1	WMR5	WMR4	WMR3	WMR2	WMR1	WMR0	0	0	WMG5	WMG4	WMG3	WMG2	WMG1	WMG0	0	0
KZJII	P	OR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R24h	W	1	0	0	0	0	0	0	0	0	WMB5	WMB4	WMB3	WMB2	WMB1	WMB0	0	0
KZ4II	P	OR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**WMR[5:0], WMG[5:0], WMB[5:0]:** In writing to the GDDRAM, these bits write-mask the data to be written to the GDDRAM by a bit unit. For example, if WMR5 = 1, the WMR5 write-mask is enabled and data RR5 will be masked and not write into the GDDRAM. WMR[5:0] mask pins RR[5:0], WMG[5:0] mask pins GG[5:0], and WMB[5:0] mask pins BB[5:0]. For writing GDDRAM methods, refer to Section 14 Interface Mapping".

K4DII	PC	OR .	0	0	0	0	0	0	0	1	0	0	1	1	1	1	1	1

**SS2[8:0]:** Specify the driving start position for the second screen in a line unit. The LCD driving starts from the set gate driver. The second screen is driven when SPT = "1".

**SE2[8:0]:** Specify the driving end position for the second screen in a line unit. The LCD driving is performed to the set gate driver. For instance, when SPT = "1", SS2[8:0] = "20"H, and SE2[8:0] = "2F"H are set, the LCD driving is performed from G32 to G47. Ensure that  $SS1[8:0] \le SE1[8:0] \le SE2[8:0] \le SE2[8:0] \le 13FH$ .

#### RAM address set (R4Eh-R4Fh)

Reg#	R/W	DC	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
R4Eh	W	1	0	0	0	0	0	0	0	0	XAD7	XAD6	XAD5	XAD4	XAD3	XAD2	XAD1	XAD0
K4EN	POR		0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R4Fh	W	1	0	0	0	0	0	0	0	YAD8	YAD7	YAD6	YAD5	YAD4	YAD 3	YAD 2	YAD 1	YAD 0
K4FII	P	OR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**XAD[7:0]:** Make initial settings for the GDDRAM X address in the address counter (AC). **YAD[8:0]:** Make initial settings for the GDDRAM Y address in the address counter (AC).

After GDDRAM data are written, the address counter is automatically updated according to the settings with AM, I/D bits and setting for a new GDDRAM address is not required in the address counter. Therefore, data are written consecutively without setting an address. The address counter is not automatically updated when data are read out from the GDDRAM. GDDRAM address setting cannot be made during the standby mode. The address setting should be made within the area designated with window addresses.

Solomon Systech Sep 2006 | P 50/81 | Rev 1.1 | SSD1289

#### **Window Address Function**

The window address function enables writing display data sequentially in a window address area made in the internal GDDRAM. The window address area is made by setting the horizontal address register (start: HSA7-0, end: HEA 7-0 bits) and the vertical address register (start: VSA8-0, end: VEA8-0 bits). The AM and ID[1:0] bits set the transition direction of RAM address (either increment or decrement, horizontal or vertical, respectively). Setting these bits enables the SSD1289 to write data including image data sequentially without taking the data wrap position into account. The window address area must be made within the GDDRAM address map area.

#### Condition:

 $00h \le HSA[7:0] \le HEA[7:0] \le EFh$   $00h \le VSA[8:0] \le VEA[8:0] \le 13Fh$ AM and ID[1:0] refer to R11h

Window address setting area: HSA[7:0] = 3Bh; HEA[7:0] = B3h VSA[8:0] = 8Bh; VEA[8:0] = B3h AM = "0" and ID[1;]] = "11"

#### **Partial Display Mode**

The SSD1289 enables to selectively drive two screens at arbitrary positions with the screen-driving position registers (R48h to R4Bh). Only the lines required to display two screens at arbitrary positions are selectively driven to reduce the power consumption.

The first screen driving position registers (R48 and R49) specifies the start line (SS18-10) and the end line (SE18-10) for displaying the first screen. The second screen driving position register (R4A) specifies the start line (SS28-20) and the end line (SE28-20) for displaying the second screen. The second screen control is effective when the SPT bit is set to 1. The total number of lines driven for displaying the first and second screens must be less than the number of lines to drive the LCD.

#### Condition:

 $SS1[8:0] \leq SE1[8:0] \leq 13FH$ 

 $SS1[8:0] \le SE1[8:0]$ 

 $SS2[8:0] \le SE2[8:0] \le 13FH$ 

The number of driven display lines: MUX[8:0] = 13F (319+1 lines)

 $1^{st}$  screen setting: SS[18:10] = 00h, SE[18:10] = 09h

 $2^{\text{nd}}$  screen seeting: SS[28:10] = 96h, SE[28:10] = 9Fh

Solomon Systech Sep 2006 | P 52/81 | Rev 1.1 | SSD1289

## 10 GAMMA ADJUSTMENT FUNCTION

The SSD1289 incorporates gamma adjustment function for the 262,144-color display. Gamma adjustment is implemented by deciding the 8-grayscale levels with angle adjustment and micro adjustment register. Also, angle adjustment and micro adjustment is fixed for each of the internal positive and negative polarity. Set up by the liquid crystal panel's specification.

# 10.1 Structure of Grayscale Amplifier

Below figure indicates the structure of the grayscale amplifier. It determines 8 levels (VIN0-VIN7) by the gradient adjuster and the micro adjustment register. Also, dividing these levels with ladder resistors generates V0 to V63.

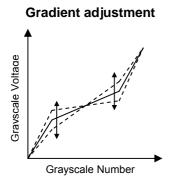

**Solomon Systech** Sep 2006 | P 54/81 | Rev 1.1 | **SSD1289** 

**SSD1289** | Rev 1.1 | P 55/81 | Sep 2006 | **Solomon Systech** 

#### 10.2 Gamma Adjustment Register

This block is the register to set up the grayscale voltage adjusting to the gamma specification of the LCD panel. This register can independent set up to positive/negative polarities and there are three types of register groups to adjust gradient, amplitude, and micro-adjustment on number of the grayscale, characteristics of the grayscale voltage. (Using the same setting for Reference-value and R.G.B.) Following graphics indicates the operation of each adjusting register.

#### 10.2.1 Gradient adjusting register

The gradient-adjusting resistor is to adjust around middle gradient, specification of the grayscale number and the grayscale voltage without changing the dynamic range. To accomplish the adjustment, it controls the variable resistors in the middle of the ladder resistor by registers (PRP(N)0 / PRP(N)1) for the grayscale voltage generator. Also, there is an independent resistor on the positive/negative polarities in order for corresponding to asymmetry drive.

#### 10.2.2 Amplitude adjusting register

The amplitude-adjusting resistor is to adjust amplitude of the grayscale voltage. To accomplish the adjustment, it controls the variable resistors in the boundary of the ladder resistor by registers (VRP(N)0 / VRP(N)1) for the grayscale voltage generator. Also, there is an independent resistor on the positive/negative polarities as well as the gradient-adjusting resistor.

#### 10.2.3 Micro adjusting register

The micro-adjusting register is to make subtle adjustment of the grayscale voltage level. To accomplish the adjustment, it controls each reference voltage level by the 8 to 1 selector towards the 8-level reference voltage generated from the ladder resistor. Also, there is an independent resistor on the positive/negative polarities as well as other adjusting resistors.

Solomon Systech Sep 2006 | P 56/81 | Rev 1.1 | SSD1289

#### 10.3 Ladder Resistor / 8 to 1 selector

This block outputs the reference voltage of the grayscale voltage. There are two ladder resistors including the variable resistor and the 8 to 1 selector selecting voltage generated by the ladder resistor. The gamma registers control the variable resistors and 8 to 1 selector resistors.

#### Variable Resistor

There are 3 types of the variable resistors that are for the gradient and amplitude adjustment. The resistance is set by the resistor (PRP(N)0 / PRP(N)1) and (VRP(N)0 / VRP(N)1) as below.

PRP(N)[0:1]	Resistance
000	0R
001	4R
010	8R
011	12R
100	16R
101	20R
110	24R
111	28R

#### 8 to 1 selecter

In the 8 to 1 selector, a reference voltage VIN can be selected from the levels which are generated by the ladder resistors. There are six types of reference voltage (VIN1 to VIN6) and totally 48 divided voltages can be selected in one ladder resistor. Following figure explains the relationship between the micro-adjusting register and the selecting voltage.

		Post	tive pola	rity			Negative polarity

#### 11 MAXIMUM RATINGS

Maximum Ratings (Voltage Referenced to V<sub>SS</sub>)

Symbol	Parameter	Value	Unit
VDDIO	Supply Voltage	-0.3 to +4.0	V
VDDEXT		-0.3 to +4.0	V
VCI	Input Voltage	VSS - 0.3 to 5.0	V
1	Current Drain Per Pin Excluding $V_{\text{DDIO}}$ and $V_{\text{SS}}$	25	mA
T <sub>A</sub>	Operating Temperature	-20 to +70	°C
T <sub>stg</sub>	Storage Temperature	-65 to +150	°C

Maximum ratings are those values beyond which damages to the device may occur. Functional operation should be restricted to the limits in the Electrical Characteristics tables or Pin Description section.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, strong electric fields, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices. It is advised that proper precautions to be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit. For proper operation it is recommended that VCI and Vout be constrained to the range VSS < VDDIO  $\leq$  VCI < V<sub>OUT</sub>. Reliability of operation is enhanced if unused input is connected to an appropriate logic voltage level (e.g., either VSS or VDDIO). Unused outputs must be left open. This device may be light sensitive. Caution should be taken to avoid exposure of this device to any light source during normal operation. This device is not radiation protected.

## 12 DC CHARACTERISTICS

**DC Characteristics** (Unless otherwise specified, Voltage Referenced to  $V_{SS}$ ,  $V_{DDIO} = 1.65$  to 3.6V,  $T_A = -20$  to  $70^{\circ}C$ )

Symbol	Parameter	Test Condition	Min	Тур	Max	Unit
VDDIO	Power supply pin of IO pins	Recommend Operating Voltage Possible Operating Voltage	1.4	-	3.6	V
VDDEXT	Auxiliary power supply pin for VDD	Recommend Operating Voltage Possible Operating Voltage	1.4	-	3.6	V
VCI	Booster Reference Supply Voltage Range	Recommend Operating Voltage Possible Operating Voltage	2.5 or VDDIO whichever is higher	-	3.6	V
